

The FINCKH Screen as final stage also operates with the performance-proven principle of the FINCKH Vertical Screen. Sufficient volume and retention time are made available for the rejects to be intermittently discharged in a concentrated form. The FINCKH Final Screen which, in many cases, replaces open systems, guarantees minimal fibre loss.

As the screen basket allows only an outflow in the upper part and the rejects are discharged intermittently, sufficient volume and retention time are available for the rejects washing process.

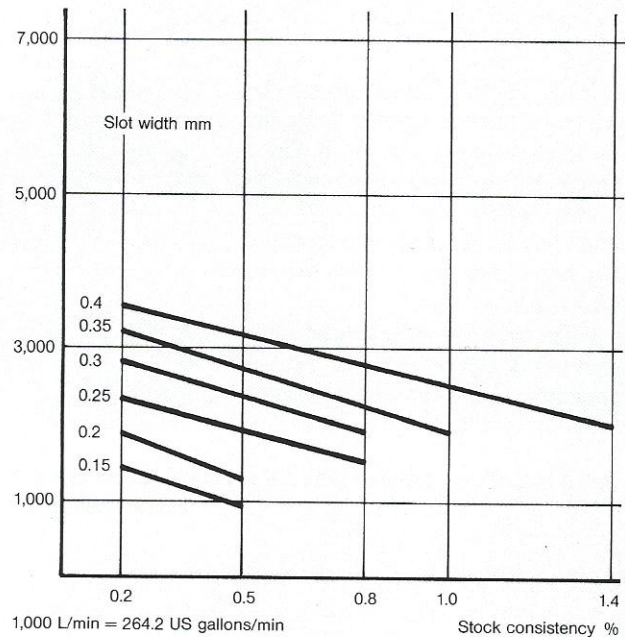

L/min/m² Screening area

Throughput capacities of the FINCKH Screen as final stage using drilled screen baskets.

L/min/m² Screening area

Throughput capacities of the FINCKH Screen as final stage using slotted screen baskets.
